Office on Drugs and Crime

Cannabis Use For Non-Medical Purposes

Gilberto Gerra
Chief

Drug Prevention and Health Branch

Cannabis: not a new medicine

Substances contained in cannabis

483 known compounds
in the plant:

tetrahydrocannabinol (THC)

84 other cannabinoids:

cannabidiol (CBD)

cannabinol (CBN)

tetrahydrocannabivarin (THCV)

cannabigerol (CBG)

Lots of media information

Lots of anecdotal information

Petition: allow veterans diagnosed with PTSD
use of medicinal cannabis nationwide.

The endogenous cannabinoids

Anandamide

Virodhamine

N-arachidonoyldopamine

2-Arachidonoylglycerol

Noladin ether

Cannabinoid Receptor

Cannabinoid Receptors Are Located Throughout the Brain and Regulate:

- Brain Development
- Memory and Cognition
- Motivational Systems & Reward
- Appetite
- Immunological Function
- Reproduction
- Movement Coordination
- Pain Regulation & Analgesia

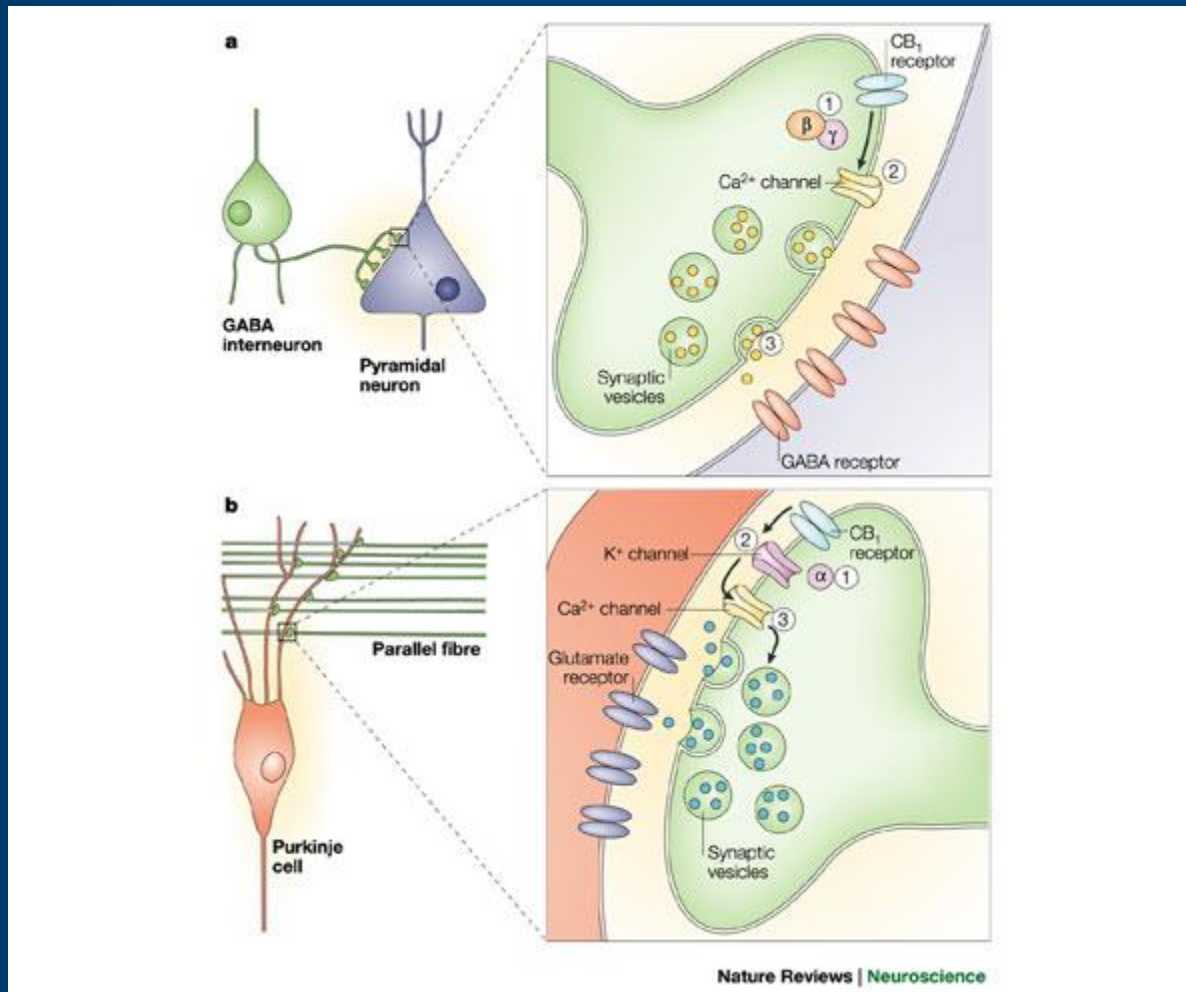

Distribution of Brain CB1 Receptors

- Hippocampus – Memory and Learning
- Amygdala – Novelty, Emotion, Appetitive Behaviour
- Basal Ganglia & Motor Cerebellum – Real Time Coordination, Selective Attention and Time Sense
- Nucleus Accumbens - Reward Mechanisms
- Cortex & Frontal Lobe - Executive Function, Judgment, Synthesis, Evaluation

Retrograde Signaling & the Cannabinergic System

Pre-synaptically located CB1 cannabinoid receptors regulate GABA Release from Axon Terminals

Psychopharmacology (Berl)

Cannabinol and cannabidiol exert opposing effects on rat feeding patterns.

Farrimond et al., 2012.

$\Delta(9)$ -tetrahydrocannabinol-induced

- Increase in food consumption

Cannabinol

- increase in appetitive behavior and food intake

Cannabidiol

- reduction in food intake

an alternative to psychotropic $\Delta(9)$ -tetrahydrocannabinol-based medicines since cannabidiol is considered to be **non-psychotropic**.

Neuro Endocrinol Lett.

**Clinical endo-cannabinoid deficiency revisited:
can this concept explain the therapeutic benefits
of cannabis in migraine, fibromyalgia,
irritable bowel syndrome?**

underlying

endo-cannabinoid deficiencies

play a role

in migraine, fibromyalgia,

irritable bowel syndrome

Smith and Wagner, 2014

Biol Psychiatry.

Moderation of the effect of adolescent-onset cannabis use on adult psychosis by a functional polymorphism in the catechol-O-methyltransferase gene: longitudinal evidence of a gene X environment interaction.

Caspi et al., 2005

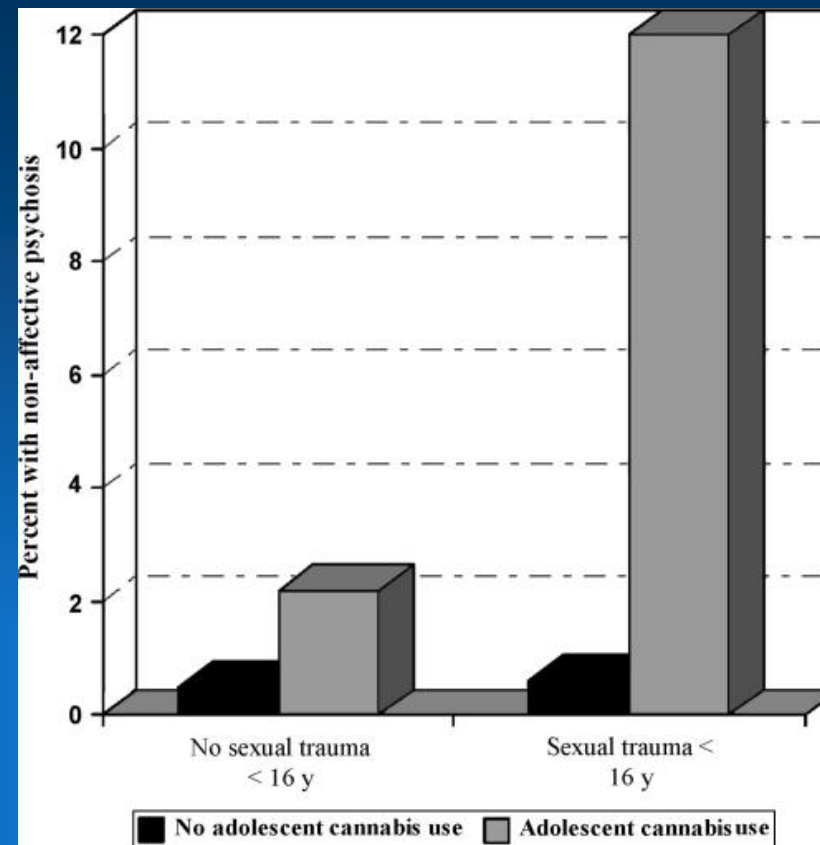

A functional polymorphism in the catechol-O-methyltransferase (COMT) gene moderated the influence of adolescent cannabis use on developing adult psychosis

COMT valine158 allele

psychotic symptoms
if they used cannabis

COMT methionine allele

no such adverse influence

Schizophr Bull.

Gene-environment interplay between cannabis and psychosis.

Henquet et al., 2008

The epidemiological literature in the past 20 years shows that regular cannabis use induces:

- risk of accidents
- dependence
- poor psychosocial outcomes
- mental health problem in adulthood

Some researchers still argue that these relationships are explained by shared causes or risk factors

One in six teenagers who regularly smoke the drug become dependent on it

Cannabis doubles the risk of developing psychotic disorders (schizophrenia)

Cannabis users do worse at school

Heavy use in adolescence appears to impair intellectual development and memory.

One in ten adults who regularly smoke the drug become dependent on it

Cannabis users are more likely to go on to use harder drugs

Driving after smoking cannabis doubles the risk of a car crash

Smoking it while pregnant reduces the baby's birth weight

Adverse health effects of marijuana use.

Volkow et al., N. Engl J Med., 2014

Acute psychosis

Chronic psychosis

Depression

Anxiety

Suicidal thoughts

Personality disturbances

Lack of motivation

ORIGINAL PAPER

Psychobiological responses to unpleasant emotions in cannabis users

Lorenzo Somaini · Matteo Manfredini · Mario Amore ·
Amir Zaimovic · Maria Augusta Raggi · Claudio Leonardi ·
Maria Lidia Gerra · Claudia Donnini · Gilberto Gerra

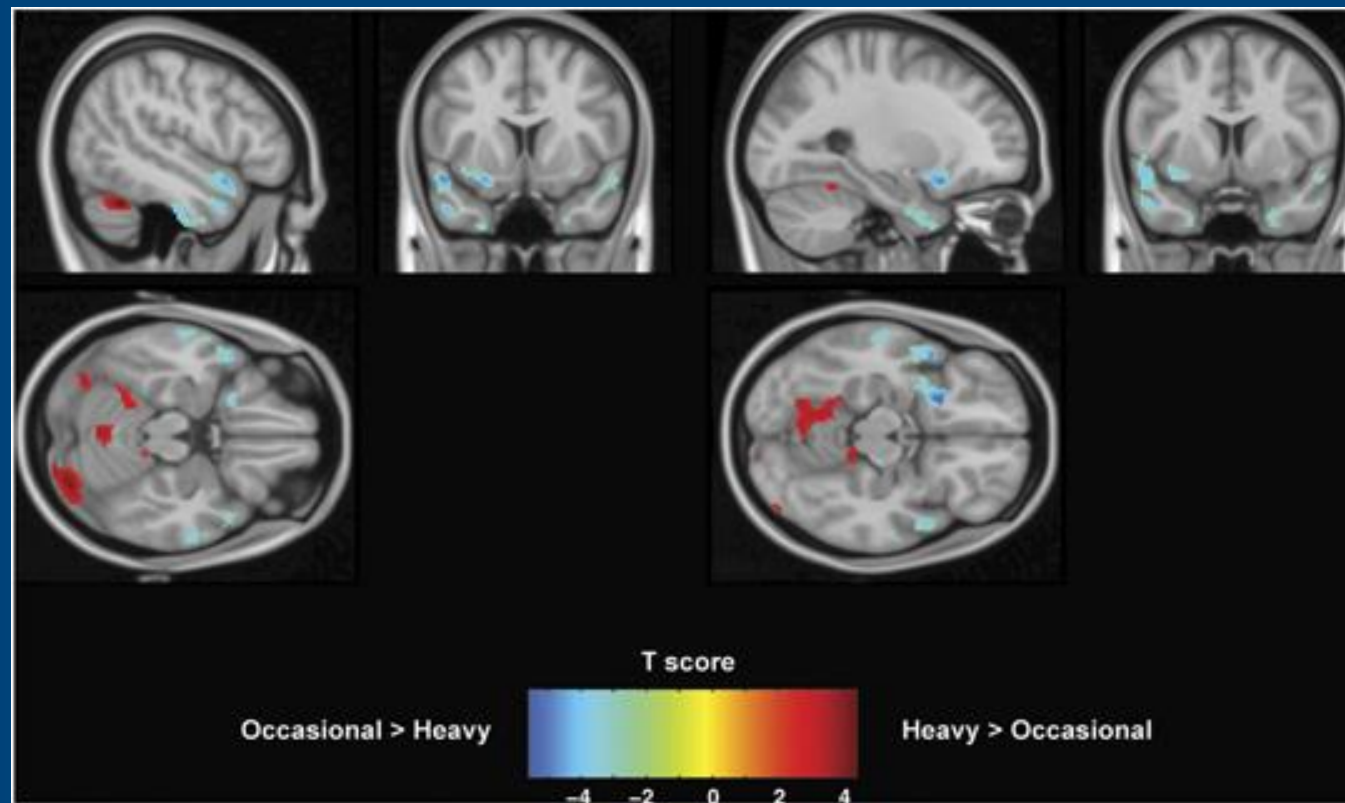

lower levels of arousal in response to negative emotions
compared to abstinent cannabis users and controls

a persistent hyperactivity of hypothalamus-pituitary-adrenal (HPA) axis

impaired hormonal reaction to negative emotions, in comparison
with healthy subjects.

reduced sensitivity to negative emotions

Neuropsychopharmacology 39, 2041–2048
Long-Term Effects of Cannabis on Brain Structure
Battistella et al., 2014

Cold color bar shows regions where gray matter volume is lower in regular smokers compared with occasional ones.

Cannabis and schizophrenia

Shared risk factors:
parallel development
of co-occurring disorders

Causal model: in vulnerable
or non-vulnerable population

Self-medication model

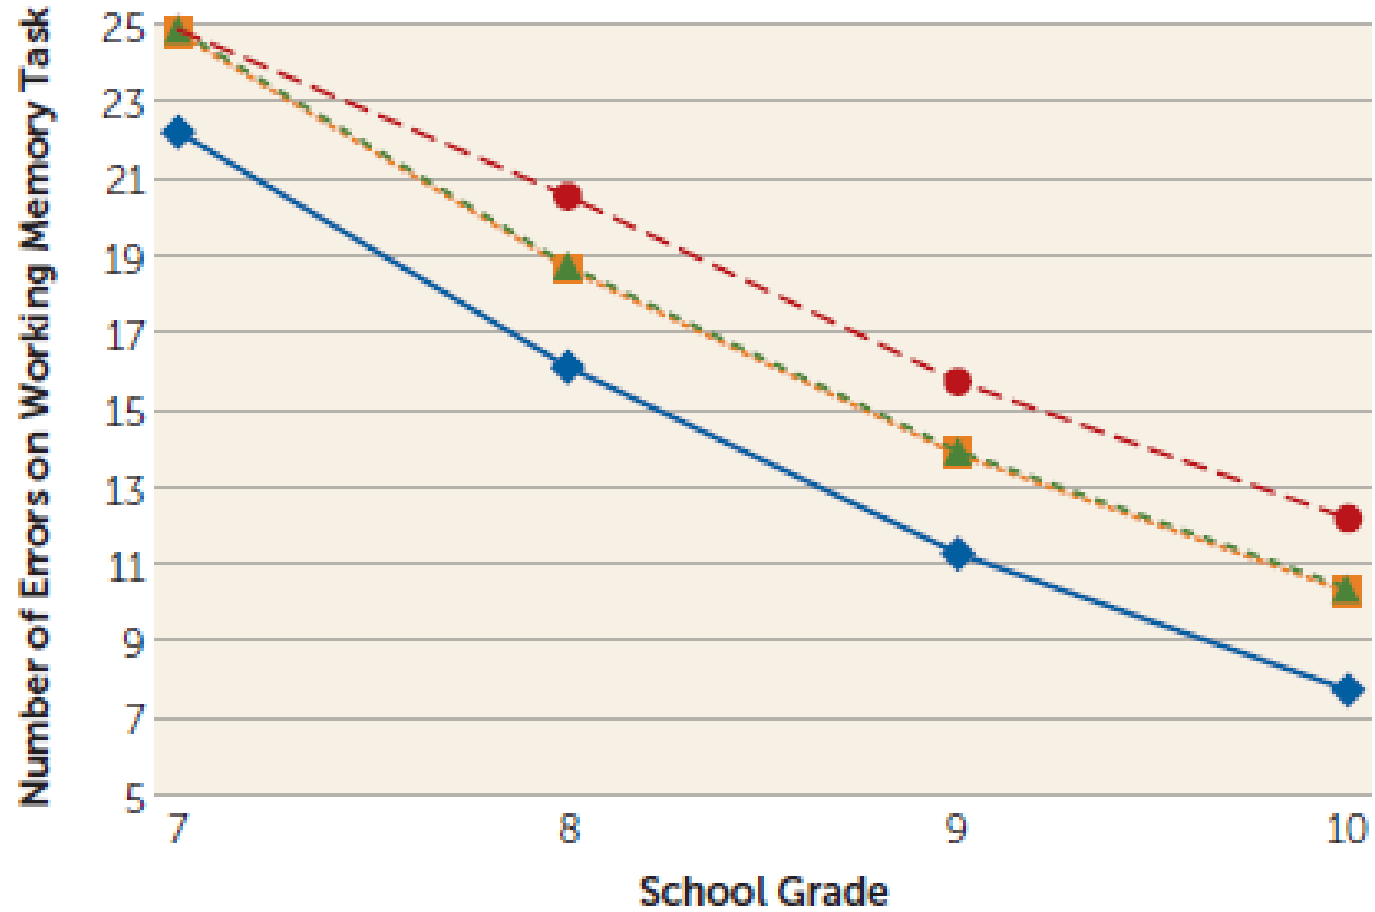

Figure 1: Crude and fully adjusted ORs of psychotic disorders for the combined measure of frequency plus type of cannabis use in the whole sample
 Crude ORs are adjusted only for age, gender and ethnicity and fully adjusted ORs are additionally adjusted for level of education, employment status, and use of tobacco, stimulants, ketamine, legal highs, and hallucinogenics. Error bars represent 95% CIs. OR=odds ratio.

A. Cannabis Use Frequency and Working Memory

Morin et al., 2018

B. Cannabis Use Frequency and Perceptual Reasoning

Morin et al., 2018

Minorities with lower socioeconomic status had higher prevalence of ever using marijuana and incidence of past year initiation as compared with affluent social groups.

(Forman-Hoffman et al., 2017)

A decrease of cannabis use has been evidenced among youth from affluent families, in contrast to youth from low family affluent status, with heavier use pattern

(ter Bogt et al., 2014)

In terms of consumption of cannabis and other controlled drugs, the unemployed and students with low educational level ('Hauptschule': vocational school) emerged as high-risk groups (Henkel and Zemlin, 2016).

low educational level
=
risk

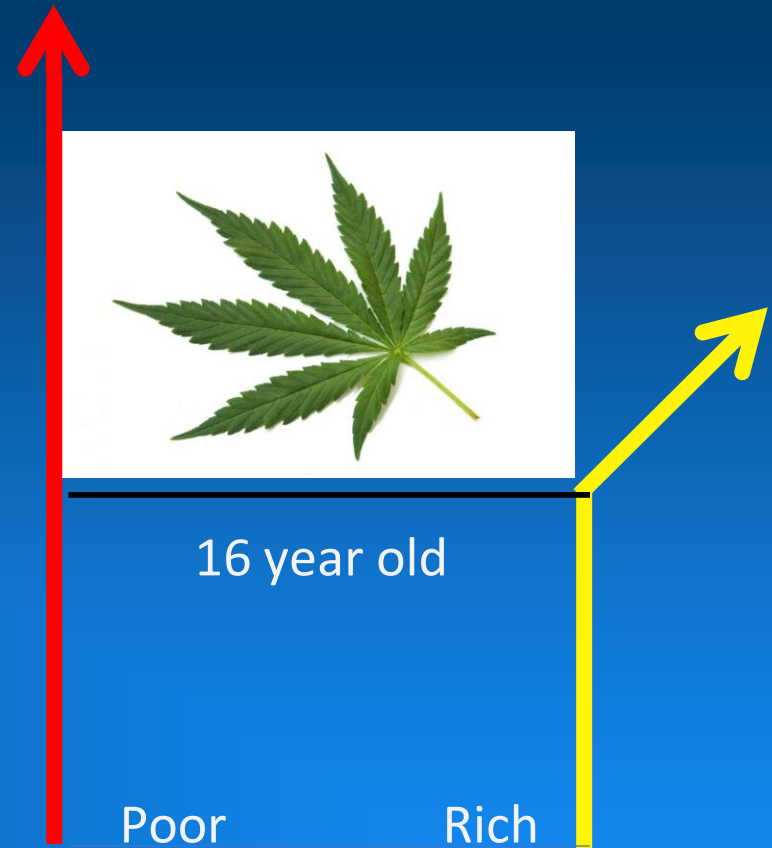

high educational level
=
resilience

Adolescent from high socioeconomic status **try cannabis (episodic experimenting) more often** than young people from lower socioeconomic status.

However, cannabis regular use, with the risk of being affected by **cannabis use disorders**, associated with a lower socioeconomic status, bad school results, early school leaving.

Young people from high socioeconomic status **dispose of greater sociocultural resources to master and regulate their consumption**

(Beck et al., 2013)

Socioeconomic status and parental education in vulnerability for substance use disorders

Gilberto Gerra, Elisa Benedetti, Giuliano Resce, Sabrina Molinaro

The sample (Males = 24,136; Females = 26,300)

28 out of the 35 countries that participated in 2015 ESPAD data collection

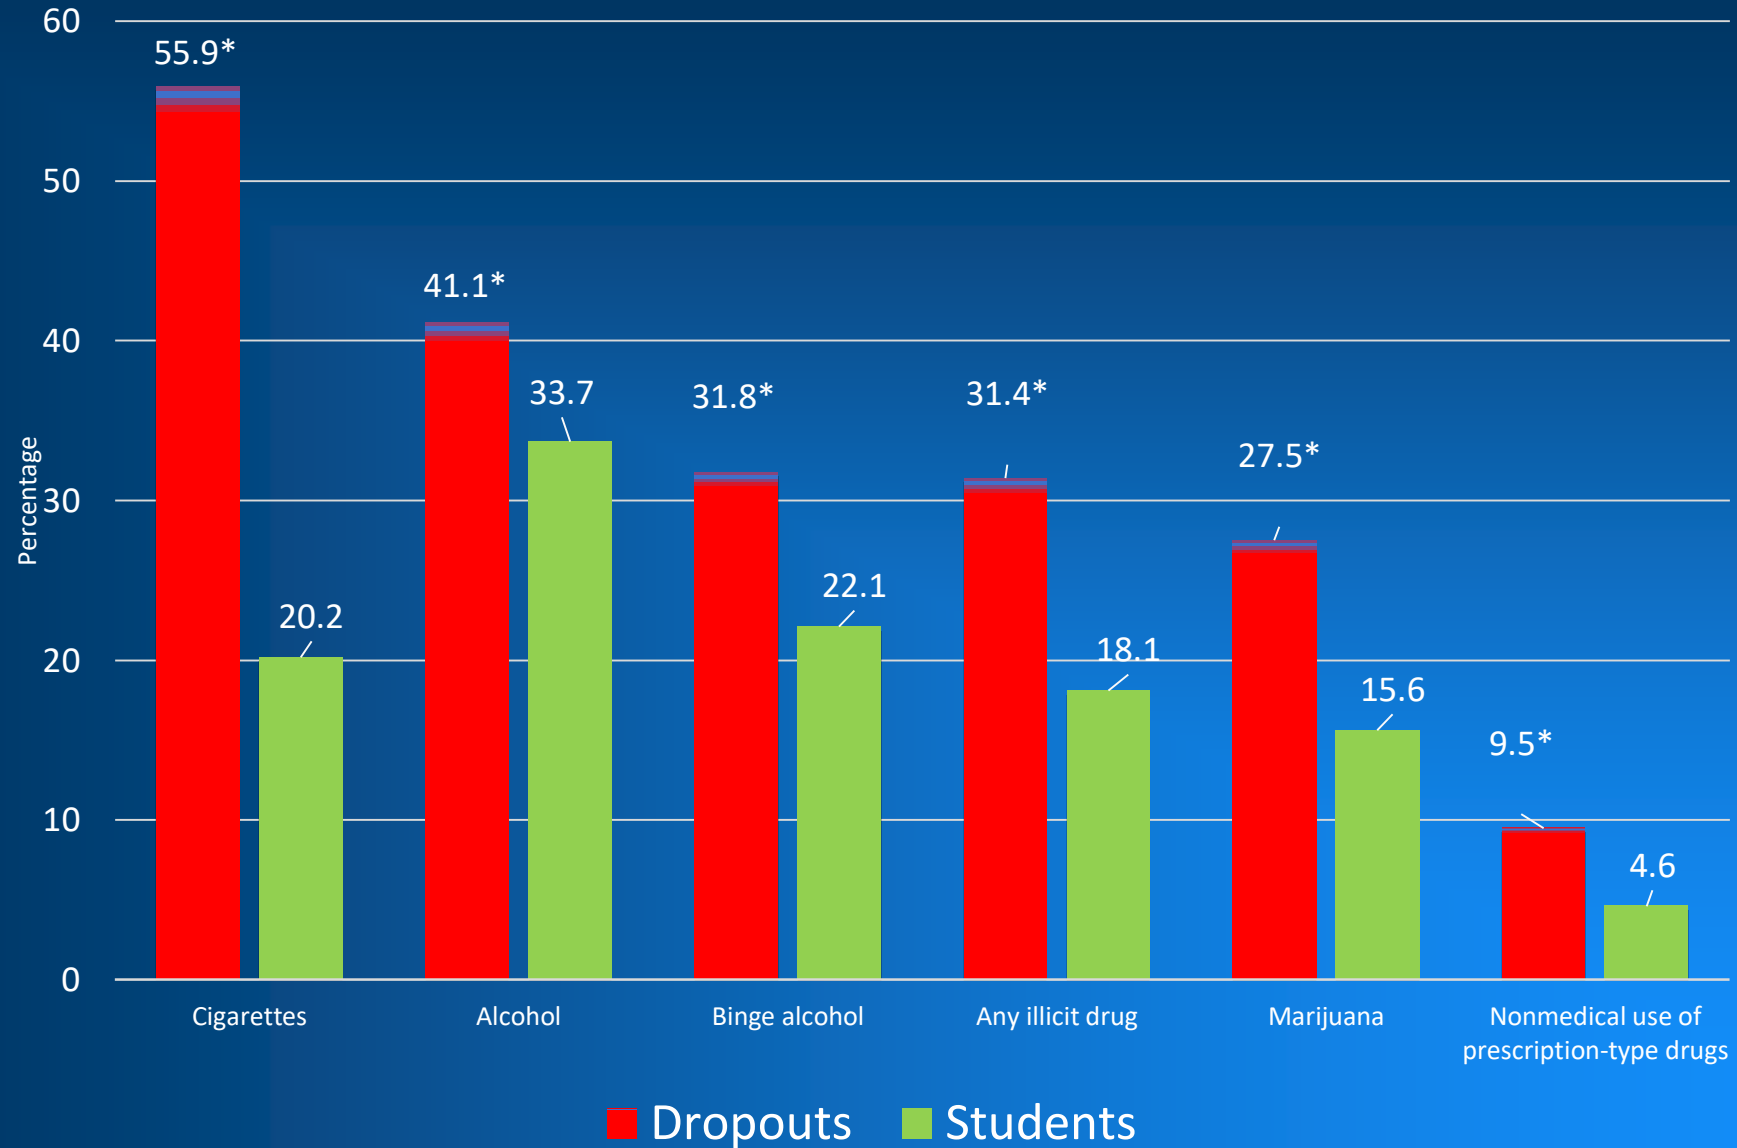

Figure 1. Past month substance use among youth in schools and youth that have dropped out of school (12th grade aged youth)
