1 Introduction

The research is motivated by the results of a preliminary study at the Indonesian National Narcotics Board Drug Rehabilitation Center, Bogor, Indonesia, which shows the existence of drug abuse across a wide range of age groups (12-60 years) and various types of drugs, namely methamphetamine, THC, MDMA, benzodiazepine, opiates, and other drugs.

2 Methods

This type of research is descriptive analytic with a quantitative approach, a retrospective design, and data analyzed using the Chi-Square test. The sampling technique used was total sampling of 290 respondents, and the data measuring instrument was a checklist sheet.

3 Objectives

The purpose of this study was to determine the correlation between age and drug abuse at the Rehabilitation Center of the National Narcotics Board in 2019.

4 Results

The majority of clients misused methamphetamine; as many as 233 respondents Aged 12-25 years were 146 respondents (50.3%). (80.3%) did so.

5 Discussion

The results of this study indicate that 121 respondents (51.9%) aged 26-45 abused methamphetamine.

The statistical test using the Chi-Square Test yielded a p value of 0.000. A p value < 0.05 indicates that H_0 is rejected and H_a is accepted, indicating a significant relationship between age and drug abuse at the Lido National Narcotics Board Rehabilitation Center in 2019.

When a person's psychosocial developmental stages, particularly between the ages of 21 and 40 (intimacy versus isolation), are not progressing as they should, this isolation can be a factor in someone abusing drugs as a way to cope.
